¿Qué son?

Son componentes que tienen la función de transmitir de forma constante la fuerza (torque) del motor a las ruedas.

Los vehículos con tracción delantera utilizan dos semi-ejes, uno para cada rueda motriz.

Cada semi-eje está compuesto por dos juntas homocinéticas, una fija (lado rueda) y otra deslizante (lado caja de cambios).

Las juntas universales tradicionales permiten mayores ángulos de trabajo, menor radio de giro en vehículos de tracción delantera y mayor capacidad de torque.

¿Cómo Funcionan?

Los vehículos con tracción delantera, o semi-eje, además de transmitir la fuerza del motor a las ruedas, actúa también como sistema de dirección. Cuando un vehículo está trazando una curva en un terreno irregular, la fuerza (torque) del motor debe llegar a las ruedas de manera constante y regular.

Los componentes de las juntas fijas o deslizantes son: Carcasa externa, anillo porta-esfera o jaula, esferas, núcleo.

Límites angulares de trabajo: Juntas fijas 47°, juntas deslizantes 22°.

Es de suma importancia la correcta alineación del vehículo, debido a que de ésta depende la durabilidad del conjunto que configura la transmisión.

¿Cuándo deben ser substituidas?

Las Juntas Homocinéticas tienen una vida útil elevada, sin embargo debe tenerse especial cuidado de examinar el estado de los guarda-polvo, abrazaderas, ya que de ellas dependen el buen estado de conservación y funcionamiento del conjunto.

Es por esta razón que Cofap / Magneti Marelli también comercializa los Kits de Mantenimiento para juntas homocinéticas.

La durabilidad de las juntas depende también de la correcta conducción del vehículo según las recomendaciones del fabricante y al mantenimiento con repuestos originales y mano de obra calificada. A la menor señal de un problema en la transmisión, la misma debe ser revisada por personal profesional.

Detalle tipo de DIENTES

T = Anillo de ABS con Dientes

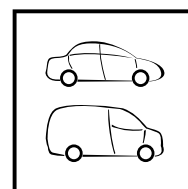

W = Anillo de ABS Tipo Ventana

JUNTAS HOMOCINÉTICAS
